WeighPlate – QA Test Report 2

Source: screen recording screen-20261013-175001.mp4 (0:54). Formulas checked against MealDetails-macro-formulas.pdf. Timestamps refer to the video.

Summary

#	Severity	Issue	Where
1	**Critical**	Editing an entry and changing the unit saves amount 0 but keeps the old calories	Result → Edit → Update (0:33 → 0:37, 0:48 → 0:52)
2	**Critical**	milk ml and oil ml: saved values differ from the preview	Edit → Update (0:42 → 0:43), Result tab (0:30)
3	**Critical**	Still present: daily calorie goal of 53,817 kcal	Dinner screen (0:28)
4	**High**	Edit screen does not load the saved nutrition	Result → Edit (0:38, 0:53)
5	**Medium**	lb:oz limit error appears for a valid weight	Meal Details, lb:oz (0:21 – 0:22)
6	**Medium**	Weight limit only applies to lb:oz	Dinner → history (0:02)
7	**Medium**	Quick Add item shows an amount it was never given	Result tab (0:30)
8	**Low**	Daily intake shows 0.0/0.0 kcal while loading	Dinner screen (0:02, 0:27)
9	**Low**	Dinner screen briefly shows a Lunch item	Dinner → Today's meal (0:02)

Top priority: bug 1 (edits save amount 0 with the old calories) and bug 2 (milk/oil ml save a different value from the preview). Both corrupt the diary. Three entries in today's diary are already affected.

Formulas used for checking

weightRatio = entered amount ÷ serving amount (lb:oz converted to grams first)
macro = serving macro × weightRatio × Qty
Rings: carb kcal = g × 4, protein kcal = g × 4, fat kcal = g × 9; % = part ÷ (sum of the three) × 100
1 lb = 453.59237 g, 1 oz = 28.349523125 g

Bug 1: Editing an entry and changing the unit saves amount 0 but keeps the old calories

CRITICAL

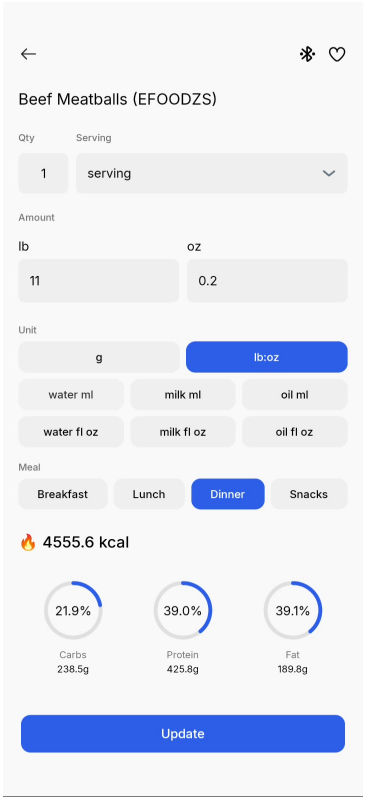

Where: Result → Edit → Update (0:33 → 0:37, 0:48 → 0:52)

Beef Meatballs was saved as **11:0.2 lb:oz = 4,555.6 kcal**. In Edit, tapping **water ml** resets Amount to **0** and the preview to 0.0 kcal. Update is accepted, and the diary now shows **0.0 water ml** with the old **4,555.6 kcal** and 425.8 g protein. The same happened again with milk fl oz: saved as **0.0 milk floz** with **401.3 kcal**. Two older entries in the diary show the same damage: Beef Ball (Som Tum) **0.0 water ml = 8,596.6 kcal**, and Beef, silverside roast **0.0 water ml = 5,909.3 kcal**.

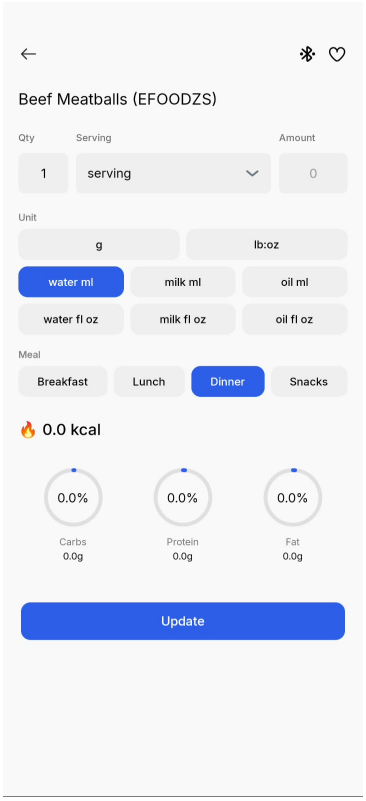

Calculation

Amount 0 should give 0 ÷ 400 × 364.8 = 0 kcal. Either the save is rejected, or kcal and macros are recalculated from the new amount. Instead, the amount changes and the nutrition does not.

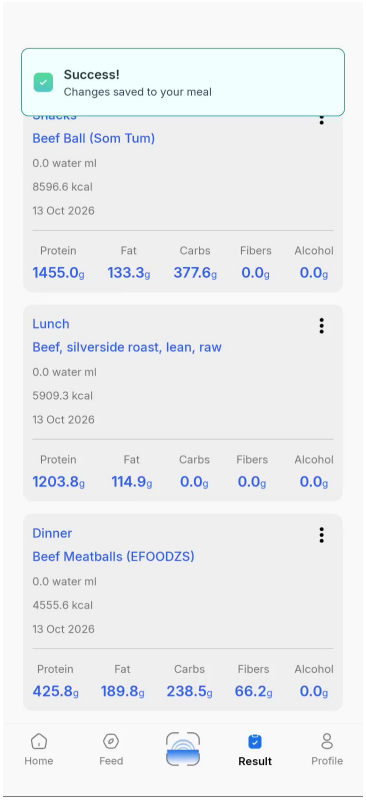

Suggested fix: Block Update when the amount is 0 or empty. When the unit changes, convert the current amount into the new unit instead of resetting it to 0. Always recalculate macros from the amount that is saved.

0:33 – Edit: 11 lb 0.2 oz = 4,555.6 kcal

0:34 – tap water ml: amount 0, 0.0 kcal

0:37 – saved: 0.0 water ml, 4,555.6 kcal

Bug 2: milk ml and oil ml: saved values differ from the preview

CRITICAL

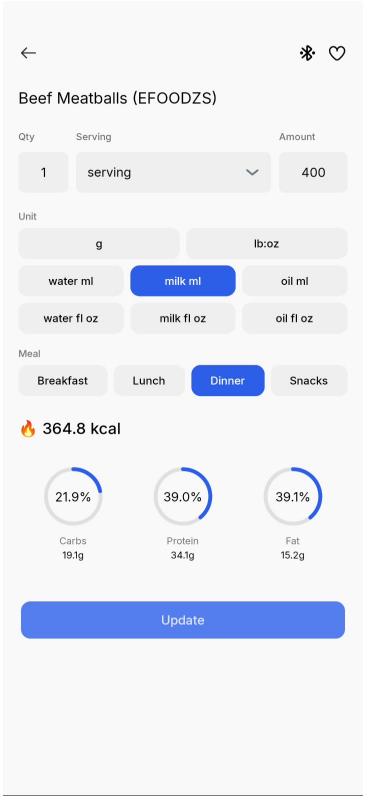

Where: Edit → Update (0:42 → 0:43), Result tab (0:30)

Beef Meatballs, **400 milk ml**: the preview shows **364.8 kcal / 34.1 g protein / 15.2 g fat / 19.1 g carbs**. The diary saves **401.3 kcal / 37.5 g / 16.7 g / 21.0 g**. Beef, diced, untrimmed, **100 oil ml** is saved as **132.1 kcal / 24.8 g protein / 3.5 g fat**, while 100 g is 146.8 / 27.6 / 3.9.

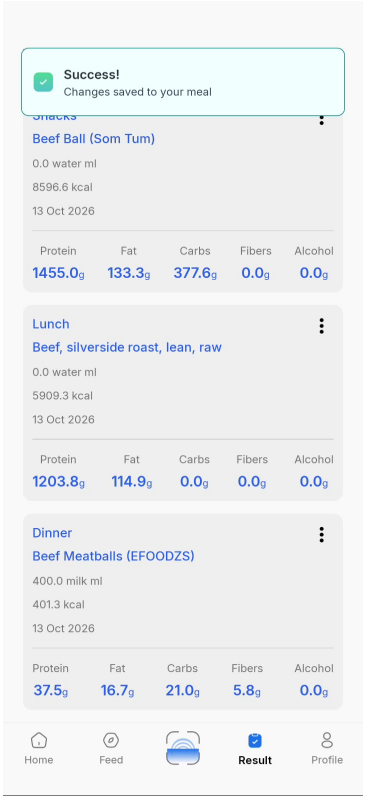

Calculation

Milk ml: 401.3 ÷ 364.8 = **1.100**; 37.5 ÷ 34.1 = 1.10; 16.7 ÷ 15.2 = 1.10; 21.0 ÷ 19.1 = 1.10.
Oil ml: 132.1 ÷ 146.8 = **0.900**; 24.8 ÷ 27.6 = 0.90; 3.5 ÷ 3.9 = 0.90.
So the save applies a density (milk 1.10 g/ml, oil 0.90 g/ml), but the preview and the macro-formulas PDF use 1.0 g/ml. Real milk is about 1.03 g/ml, so the 1.10 factor also overstates milk by about 7%.

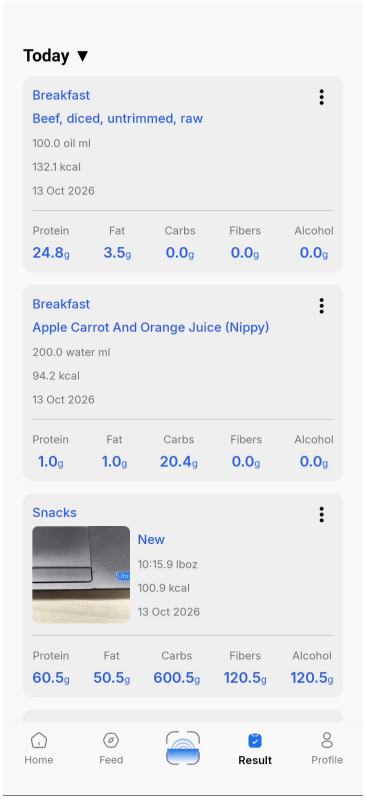

Suggested fix: Use one shared calculation for the preview and the save. If densities are intended, show them in the preview and use realistic values (milk ≈ 1.03, oil ≈ 0.92), and update the formulas document.

0:44 – preview: 400 milk ml = 364.8 kcal (same as before saving)

0:43 – saved: 400.0 milk ml = 401.3 kcal

0:30 – 100.0 oil ml = 132.1 kcal (100 g = 146.8)

Bug 3: Still present: daily calorie goal of 53,817 kcal

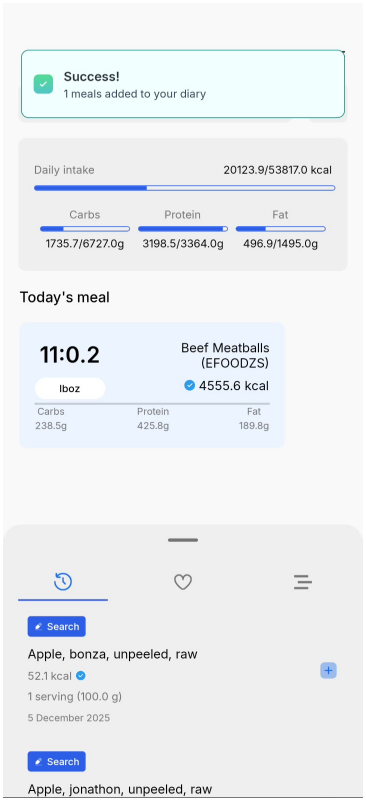

CRITICAL

Where: Dinner screen (0:28)

Bug 1 from the previous report is still there. The goal is **53,817 kcal**, with 6,727 g carbs, 3,364 g protein and 1,495 g fat. Because of it, a day with 20,123.9 kcal and 3,198.5 g protein looks like it is under target.

Calculation
A realistic goal for 58–59 kg is about 2,000–2,600 kcal.

Suggested fix: See the previous report: check the BMR inputs.

0:28 – 20,123.9 / 53,817.0 kcal

Bug 4: Edit screen does not load the saved nutrition

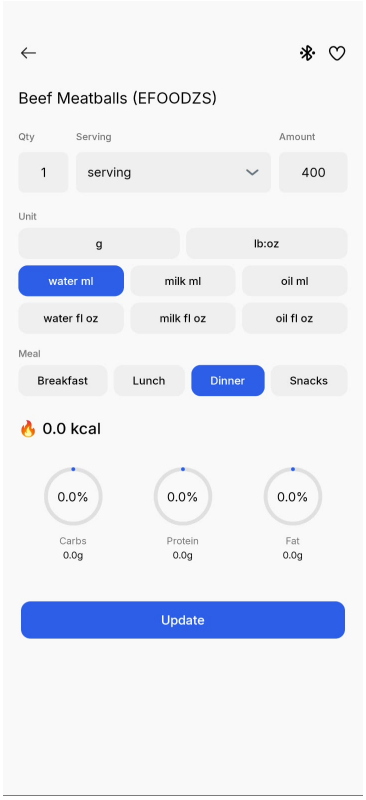

HIGH

Where: Result → Edit (0:38, 0:53)

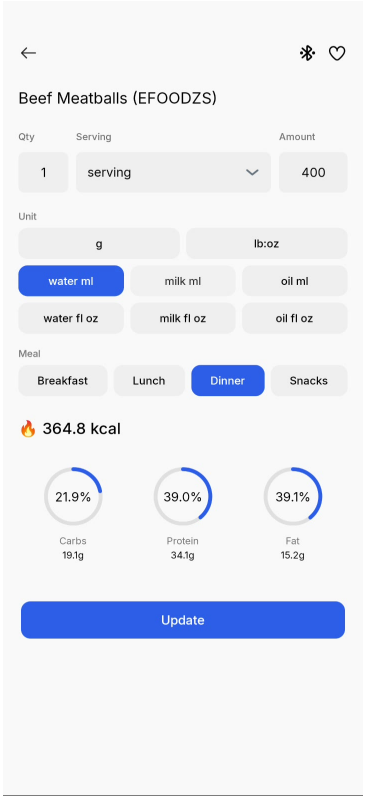

When an entry is opened for editing, the preview shows **0.0 kcal and 0.0%** on every ring, even though the entry has an amount. At 0:38 the screen opens with **400 water ml** but 0.0 kcal; the 364.8 kcal only appears after tapping a unit. At 0:53 it opens with **0.0 milk fl oz** and 0.0 kcal, while the diary says 401.3 kcal.

Calculation
Expected on open (0:38): 400 ÷ 400 × 364.8 = 364.8 kcal.

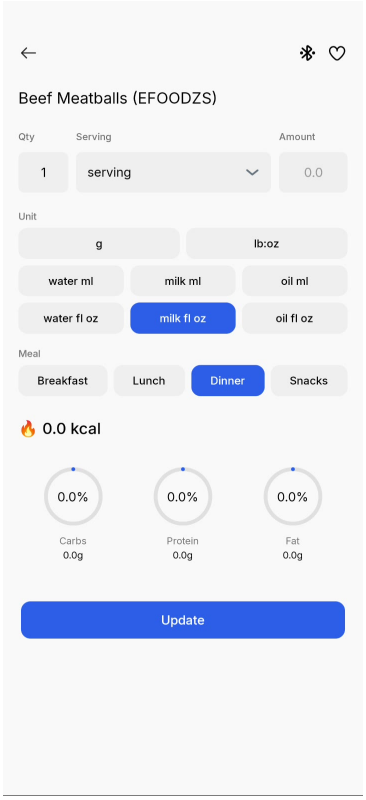

Suggested fix: Calculate the preview when the edit screen opens, from the saved amount and unit.

0:38 – opens: 400 water ml, 0.0 kcal

0:40 – after tapping unit: 364.8 kcal

0:53 – opens: 0.0 milk fl oz, 0.0 kcal

Bug 5: lb:oz limit error appears for a valid weight

MEDIUM

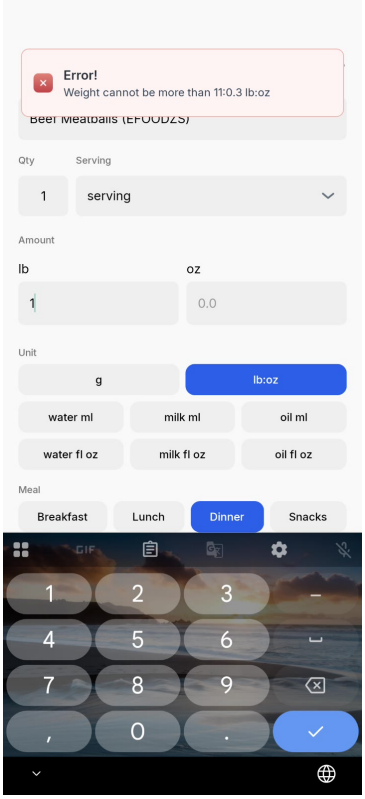

Where: Meal Details, lb:oz (0:21 – 0:22)

While typing the pounds, the toast **“Weight cannot be more than 11:0.3 lb:oz”** appears when the field shows **1** lb (and again at 11 lb), both below the limit. The final value 11 lb 0.2 oz was accepted.

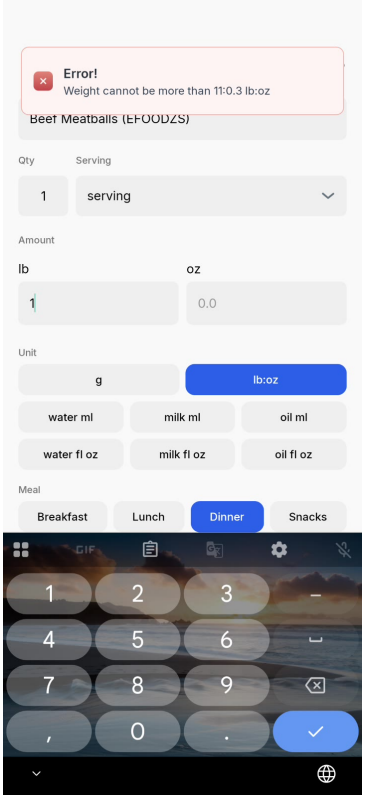

Calculation

1 lb 0 oz = 453.6 g and 11 lb 0 oz = 4,989.5 g, both under the limit of 11 lb 0.3 oz = 4,998.0 g.
The limit looks like 5,000 g = 11 lb 0.37 oz, shown rounded down as 11:0.3.

Suggested fix: Validate the final lb + oz value, not each keystroke, and compare the converted grams against the limit.

0:21 – error while lb = 1

0:22 – error toast, lb field 1/11

Bug 6: Weight limit only applies to lb:oz

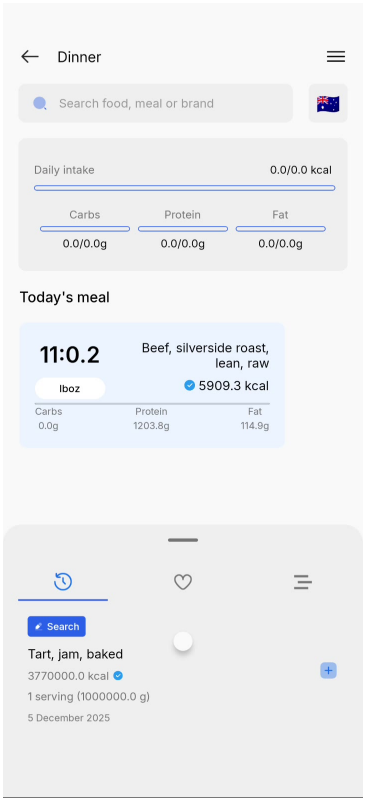

MEDIUM

Where: Dinner → history (0:02)

The history list contains **Tart, jam, baked – 1 serving (1,000,000.0 g) = 3,770,000.0 kcal** (5 Dec 2025). lb:oz is capped at about 5 kg, but 1,000 kg was accepted in grams.

Calculation
1,000,000 g ÷ 100 × 377 kcal = 3,770,000 kcal. That is 200× the lb:oz limit.

Suggested fix: Apply the same maximum (in grams) to every unit, and clean up history entries above it.

0:02 – Tart, jam: 1,000,000 g = 3,770,000 kcal

Bug 7: Quick Add item shows an amount it was never given

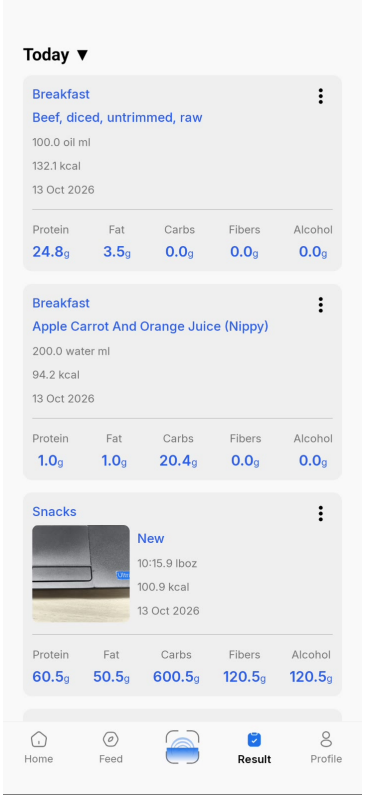

MEDIUM

Where: Result tab (0:30)

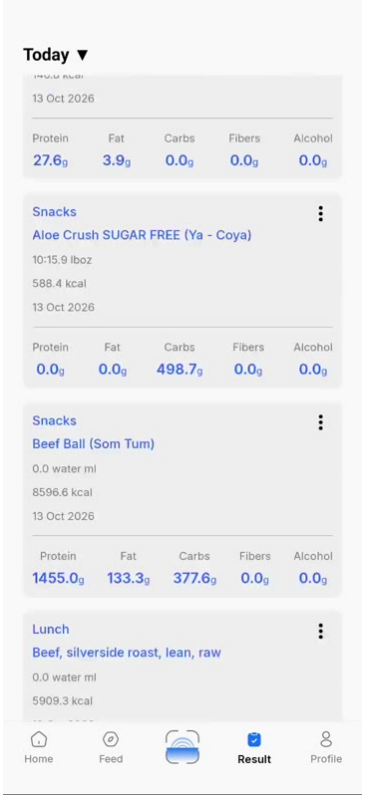

The Quick Add item “New” (from the earlier session) was entered with weight **59 water ml** and saved as a 100 g serving. The Result tab now shows it as **10:15.9 lboz**. Aloe Crush SUGAR FREE also shows 10:15.9 lboz. 10:15.9 is the exact value typed for a different food (apple) in the earlier session, so it looks like a leftover lb:oz value.

Calculation
10 lb 15.9 oz = 4,986.7 g, compared with 59 ml entered.

Suggested fix: Store and display each entry's own amount and unit. Do not reuse the last lb:oz value.

0:30 – “New”: 10:15.9 lboz, 100.9 kcal

0:30 – Aloe Crush: 10:15.9 lboz

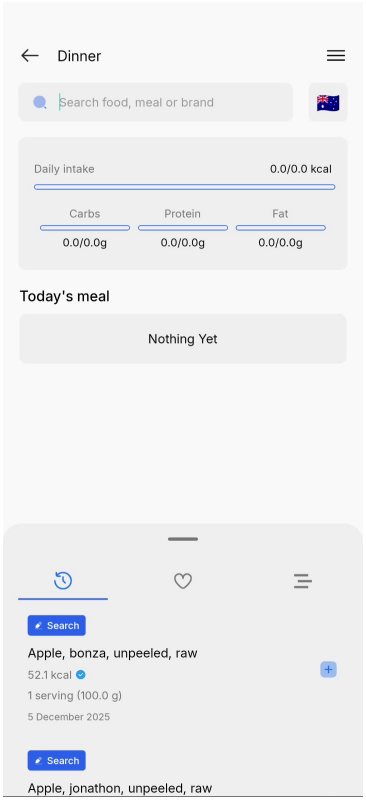

Bug 8: Daily intake shows 0.0/0.0 kcal while loading

LOW

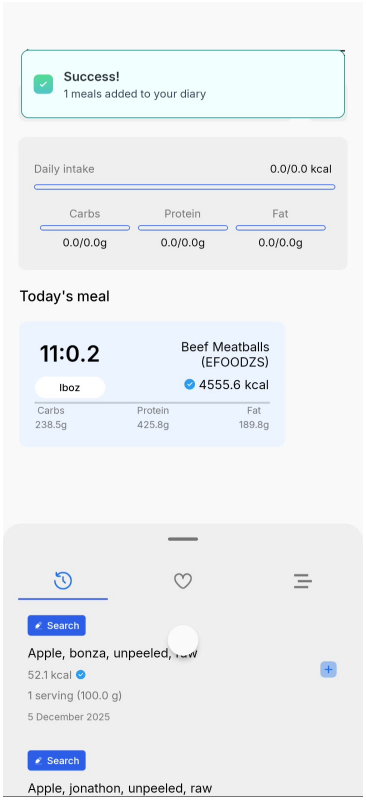

Where: Dinner screen (0:02, 0:27)

On opening Dinner, Daily intake shows **0.0/0.0 kcal** (even the goal is 0), while a 5,909.3 kcal meal is already shown on the plate. Right after “1 meals added to your diary”, it still shows 0.0/0.0 before updating to 20,123.9/53,817.

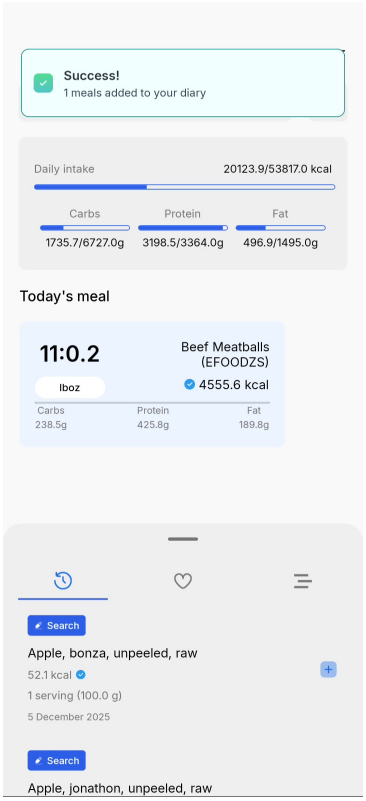

Suggested fix: Show a loader or skeleton until the totals arrive, and refresh them before showing the success toast.

0:03 – 0.0/0.0 kcal

0:27 – after save: still 0.0/0.0

0:28 – 20,123.9/53,817.0

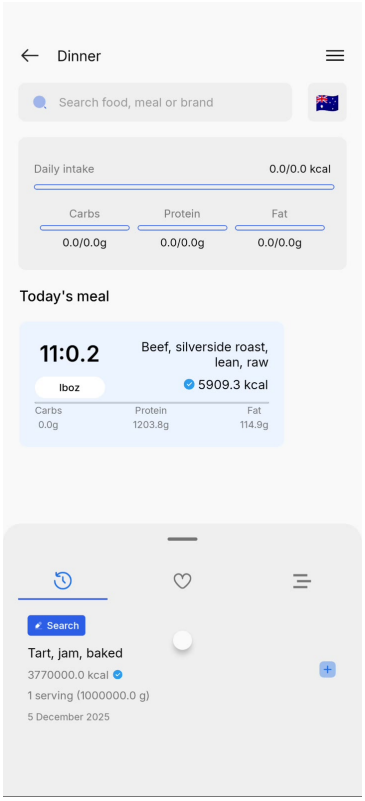

Bug 9: Dinner screen briefly shows a Lunch item

LOW

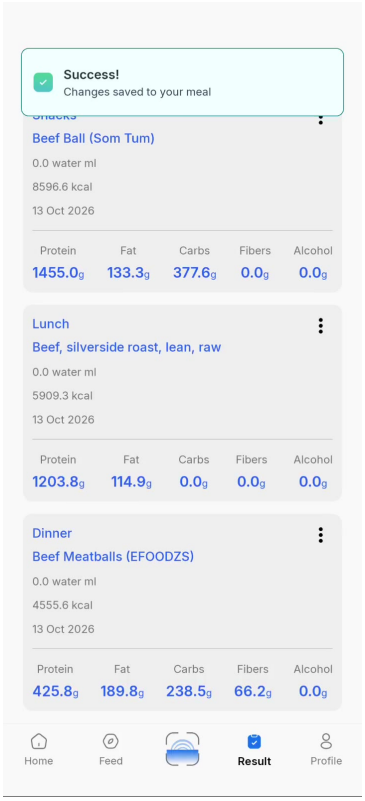

Where: Dinner → Today's meal (0:02)

The Dinner screen first shows “Nothing Yet”, then shows **Beef, silverside roast, lean, raw (11:0.2 lboz, 5,909.3 kcal)**, which is logged under **Lunch** in the Result tab. After adding meatballs, Dinner shows only the meatballs.

Suggested fix: Filter Today's meal by the selected meal type, and avoid showing stale data from another meal.

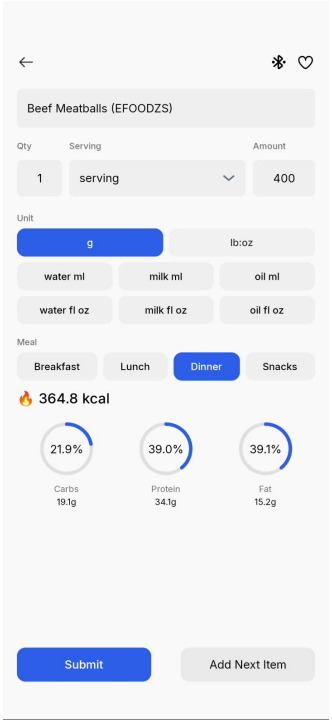

0:02 – silverside on the Dinner screen

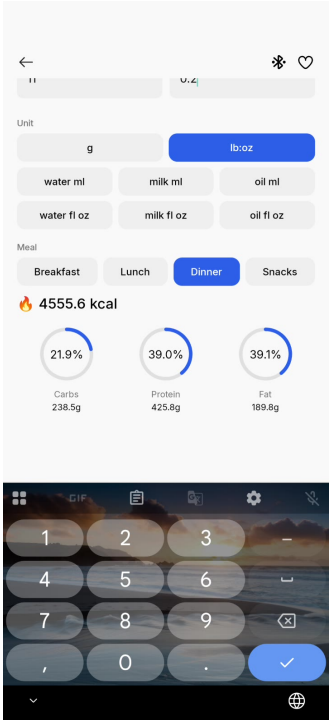

0:37 – silverside is under Lunch

Verified correct in the video

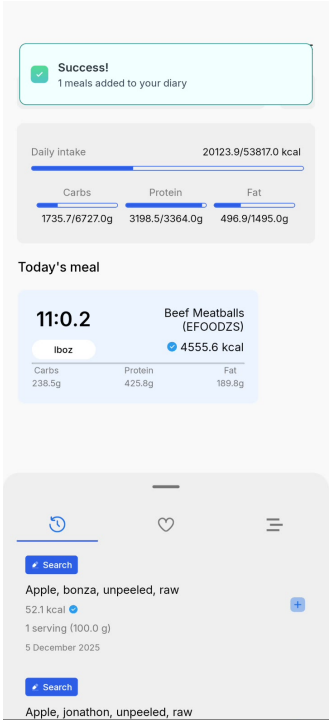

Check	Calculation	Result
Beef Meatballs, 400 g	364.8 kcal (91.2 kcal/100 g); carbs 19.1 g, protein 34.1 g, fat 15.2 g	✓
Meatballs rings	19.1×4 = 76.4; 34.1×4 = 136.4; 15.2×9 = 136.8; total 349.6 → 21.9 / 39.0 / 39.1%	✓
Meatballs, 11 lb 0.2 oz	11×453.59 + 0.2×28.35 = 4,995.2 g → 49.952 × 91.2 = 4,555.6 kcal; carbs 238.5, protein 425.8, fat 189.8 g	✓
Meatballs fibre	66.2 g at 4,995.2 g = 1.33 g/100 g, consistent with 5.3 g per 400 g	✓
Daily total	132.1 + 94.2 + 100.9 + 146.8 + 588.4 + 8,596.6 + 5,909.3 + 4,555.6 = 20,123.9 kcal	✓
Daily macros	Protein 3,198.5 g; carbs 1,735.7 g; fat 496.9 g (sum of the diary entries)	✓
lb:oz limit	Values above about 5 kg in lb:oz are blocked	✓ (but see bugs 5–6)

0:19 – 400 g = 364.8 kcal

0:25 – 11 lb 0.2 oz = 4,555.6 kcal

0:28 – daily 20,123.9 kcal
